1. Letter From the Head of Academy

Dear Delegates;

With great enthusiasm, I welcome you all to the second edition of our school's Model United Nations conference! As the Head of the Academy, I am honored to witness the extraordinary talent and dedication each of you brings to this platform for dialogue and collaboration. This year, we are excited to present six dynamic committees, each tasked with addressing some of the most significant global issues.

In the Legal Committee, delegates will engage with one of the most complex and sensitive topics of our time: the legalization of abortion. The issue of abortion has been the subject of intense debate in different parts of the world for many years, shaped around fundamental concepts such as individual bodily autonomy, the right to life, public health, and social responsibility. States have adopted various policies on this issue in line with cultural and legal differences, leading to different practices internationally.

Considering different perspectives within a framework of mutual respect, examining the effects of existing practices, and developing proposals that can provide solutions to the problems facing the international community are the most important elements of our committee. During our discussions, we will comprehensively address issues such as human rights, women's health, societal impacts, and legal regulations.

Thank you for being part of this journey. I wish you thoughtful discussions, meaningful connections, and an inspiring MUN experience. If you have any questions, my door is always open.

Sincere Regards,

Defne YAMAN *Head of
Academy*

defnee.ymn@gmail.com

1. Letter from the Under Secretary-General of WHO

Dear Delegates,

It is my great pleasure to welcome you to the World Health Organization (WHO) committee of this conference, where we will be discussing one of the most pressing global health challenges of our time: Promoting Healthier Lifestyles to Combat the Global Obesity Epidemic.

Obesity has become a rapidly growing public health issue affecting countries across all regions and income levels. It is closely linked to non-communicable diseases such as diabetes, cardiovascular diseases, and certain types of cancer, and it also has significant social and economic impacts. Addressing this issue requires not only national efforts but also strong international cooperation, innovative policies, and long-term commitment from all stakeholders.

During the sessions, I strongly encourage all delegates to engage in constructive debate, present well-researched solutions, and work collaboratively to develop comprehensive and realistic resolutions. Your ideas and cooperation will be essential in shaping effective strategies that promote healthier lifestyles and reduce the global burden of obesity.

I am confident that this committee will provide a platform for meaningful discussion and impactful solutions. I wish you all the best of luck and look forward to seeing your active participation throughout the conference.

Sincerely,

Öykü Özyıldırım

Under-Secretary-General

World Health Organization Committee

3.Introduction to the Committee

a. What is WHO?

The World Health Organization (WHO) is a specialized agency of the United Nations responsible for promoting global public health and coordinating international efforts to address health challenges. Established on 7 April 1948, WHO works with its 194 Member States to improve health outcomes, prevent diseases, and respond to health emergencies worldwide.

The organization's primary objective is to ensure that all people attain the highest possible level of health. WHO develops international health standards and guidelines, supports countries in strengthening their healthcare systems, conducts research, and provides technical assistance on a wide range of health issues. Additionally, WHO plays a crucial role in monitoring global health trends, coordinating responses to disease outbreaks, and promoting health education and disease prevention strategies.

Through its programs and initiatives, WHO addresses major public health concerns such as infectious diseases, non-communicable diseases, nutrition, mental health, maternal and child health, and environmental health. As the leading international health authority, WHO serves as a platform for cooperation among nations in tackling global health challenges and achieving sustainable health development.

4. Introduction to the Agenda Item

a. Understanding the Agenda: Key Terms and Definitions

- **Obesity:** A medical condition characterized by excessive body fat accumulation that may negatively affect health. Obesity is commonly measured using Body Mass Index (BMI), with a BMI of 30 or above classified as obesity. Obesity increases the risk of diseases such as diabetes, cardiovascular diseases, and certain cancers.
- **Overweight:** Overweight refers to having a body weight higher than what is considered healthy for a person's height. Although it is less severe than obesity, being overweight can increase the likelihood of developing obesity and related health problems.
- **Body Mass Index (BMI):** A measurement used to assess body weight relative to height. It is calculated by dividing weight (kg) by height squared (m^2).
- **Healthy Lifestyle:** A healthy lifestyle includes balanced nutrition, regular physical activity, sufficient sleep, and other habits that support physical and mental well-being. Promoting healthier lifestyles is one of the most effective ways to prevent obesity.
- **Physical Activity:** Physical activity refers to any movement of the body that requires energy expenditure. Regular exercise helps maintain a healthy weight and reduces the risk of obesity and other non-communicable diseases.
- **Balanced Diet:** A balanced diet provides the body with essential nutrients in the correct proportions. Healthy eating habits help prevent excessive weight gain and reduce obesity-related health risks.
- **Sugar-Sweetened Beverages (SSBs):** Drinks that contain added sugars, such as soft drinks, energy drinks, and sweetened juices.
- **Nutrition Labeling:** Information displayed on food packaging regarding nutritional content such as calories, sugar, fat, and salt.
- **Food Marketing:** Food marketing includes advertising and promotional strategies used to influence consumer choices. The marketing of high-sugar and high-fat products, especially to children, has been linked to increasing obesity rates.

5. Overview and Background of the Agenda Item

a. Understanding the Global Obesity Epidemic

Obesity has become one of the most serious public health challenges of the 21st century. Once considered a problem mainly affecting high-income countries, obesity now impacts people of all ages and income levels across the world. The rapid increase in obesity rates has been linked to changes in lifestyle, including unhealthy diets, reduced physical activity, and increased screen time. Today, many people consume more calories than they burn, leading to excessive weight gain.

The consequences of obesity extend beyond physical health. It increases the risk of non-communicable diseases such as type 2 diabetes, cardiovascular diseases, and certain types of cancer. In addition, obesity can affect mental health, self-esteem, and social participation. As obesity rates continue to rise among both adults and children, governments, healthcare systems, and international organizations are facing growing pressure to develop effective strategies that promote healthier lifestyles and prevent future health complications.

b. Main Causes of the Rising Obesity Epidemic

The rise of obesity is driven by a combination of lifestyle, environmental, and socioeconomic factors. One of the main causes is the increased consumption of processed foods that are high in sugar, salt, and unhealthy fats. These products are often low-cost, widely available, and heavily marketed, making them a common part of many people's diets.

Another important factor is the decline in physical activity. Technological developments, city growth, and longer periods of screen time have contributed to more inactive lifestyles. Many people spend hours sitting at school, work, or home with limited opportunities for exercise.

In addition, socioeconomic factors can influence obesity rates. In some communities, healthy food options may be less accessible or more expensive than unhealthy alternatives. Limited health education and a lack of safe spaces for physical activity can also make it difficult for individuals to maintain healthy lifestyles. Together, these factors have contributed to the growing obesity epidemic worldwide.

c. Health Consequences of Obesity

Obesity has many serious effects on human health and is strongly linked to several non-communicable diseases. One of the most common consequences is type 2 diabetes, which develops when the body has difficulty controlling blood sugar levels. Obesity also increases the risk of cardiovascular diseases such as heart attacks and strokes, as excess body fat can put extra pressure on the heart and blood vessels.

In addition, obesity can lead to certain types of cancer and cause breathing problems, especially during sleep. It may also reduce a person's overall energy levels and physical ability, making daily activities more difficult. Beyond physical health, obesity can negatively affect mental health, leading to low self-esteem, stress, and depression. Because of these serious consequences, preventing obesity is an important global health priority.

d. Social and Economic Impacts of Obesity

Obesity does not only affect physical health, but also has important social and economic consequences. In many societies, individuals with obesity may face discrimination or stigma, which can affect their confidence, education, and job opportunities. This can lead to social isolation and lower quality of life.

From an economic perspective, obesity creates a significant burden on healthcare systems due to increased medical costs for treatment and long-term care of related diseases such as diabetes and heart conditions. It also reduces productivity in the workforce, as people may experience more health problems and take more sick leave. As a result, obesity affects not only individuals but also national economies and social development.

e. The Importance of Healthy Lifestyles

Healthy lifestyles are one of the most effective ways to prevent obesity and improve overall well-being. A healthy lifestyle includes a balanced diet, regular

physical activity, enough sleep, and avoiding unhealthy habits such as excessive consumption of processed foods and sugary drinks.

By maintaining healthy habits, individuals can reduce the risk of obesity and related diseases such as diabetes and heart problems. Healthy lifestyles also improve mental health, energy levels, and quality of life. In addition, they help reduce the burden on healthcare systems by preventing many long-term diseases. For these reasons, promoting healthy lifestyles is an important global goal for governments and international organizations like WHO.

f. Growing Childhood Obesity

Childhood obesity has become a major public health concern in many countries. Over the past few decades, the number of children who are overweight or obese has increased significantly. Unhealthy diets, reduced physical activity, increased screen time, and the widespread availability of processed foods are among the main factors contributing to this trend.

Childhood obesity can have serious consequences for both physical and mental health. Children with obesity are more likely to develop health problems such as type 2 diabetes, high blood pressure, and cardiovascular diseases later in life. They may also experience low self-esteem, social difficulties, and emotional challenges. As obesity during childhood often continues into adulthood, early prevention and health education are essential for protecting future generations.

g. Food Marketing and Advertising

Food marketing and advertising have a strong influence on people's eating habits and food choices. Through television, social media, websites, and other forms of media, food companies promote a wide range of products to consumers.

Children and adolescents are especially affected by these advertisements because they spend a significant amount of time using digital media.

Many food advertisements promote products that are high in sugar, salt, and unhealthy fats. Frequent exposure to such marketing can encourage unhealthy eating habits and increase the risk of obesity. As a result, many governments and international organizations, including WHO, have called for stricter regulations on the advertising of unhealthy food products, particularly those aimed at children. Promoting healthier food options can play an important role in preventing obesity and supporting healthier lifestyles.

6. Case Studies

a. New York City Calorie Labeling Policy (2008)

In 2008, New York City became one of the first cities in the world to require chain restaurants to display calorie information on menus and menu boards. The policy was introduced to help consumers better understand the nutritional value of the food they bought. At the time, obesity rates were increasing, and many people were unaware of the high calorie content of restaurant meals. By providing clear nutritional information, the city aimed to encourage healthier food choices and raise public awareness about nutrition.

Results:

- Increased public awareness of calorie intake and nutrition.
- Encouraged consumers to make more informed food choices.
- Motivated some restaurants to introduce healthier menu options.
- Influenced similar food-labeling policies across the United States.

This case demonstrates how public policies and nutritional transparency can encourage healthier lifestyles and contribute to obesity prevention.

b. Let's Move! Campaign (2010)

In 2010, First Lady Michelle Obama launched the Let's Move! campaign to address the growing problem of childhood obesity in the United States. The initiative recognized that obesity is influenced by many factors, including poor nutrition, lack of physical activity, and limited access to healthy foods. Therefore, the campaign aimed to create healthier environments for children both at school and at home. It brought together government institutions, schools, families, healthcare professionals, and community organizations to promote healthy living.

Actions Taken:

- Encouraging regular physical activity among children.
- Improving the nutritional quality of school meals.
- Promoting nutrition education and healthy eating habits.
- Increasing access to healthy and affordable food options.
- Raising public awareness about childhood obesity.

Results:

- Increased national attention to childhood obesity.
- Improved nutrition standards in many schools.
- Encouraged healthier lifestyle choices among children and families.
- Strengthened public discussions on health and nutrition.

This case highlights the importance of education, physical activity, and community involvement in promoting healthier lifestyles and reducing childhood obesity.

c. Mexico's Sugar Tax (2014)

Mexico has long struggled with high obesity rates and related health problems, including type 2 diabetes. In response to the growing obesity epidemic, the Mexican government introduced a tax on sugar-sweetened beverages in 2014. The policy aimed to reduce the consumption of sugary drinks by making them more expensive and encouraging people to choose healthier alternatives. It was one of the first nationwide measures specifically designed to address obesity through economic policy.

Results:

- A decrease in the consumption of sugar-sweetened beverages was observed.
- The reduction was particularly noticeable among lower-income households.
- More consumers began choosing healthier drink options.
- The policy became an important example for other countries considering similar measures.

This case study shows how fiscal policies can influence consumer behavior, promote healthier choices, and contribute to reducing obesity rates.

7. Challenges and Gaps

Despite growing awareness of the obesity epidemic, significant challenges remain in promoting healthier lifestyles worldwide. One major challenge is the widespread availability and marketing of unhealthy foods that are high in sugar, salt, and unhealthy fats. These products are often more accessible than healthier alternatives, especially in low-income communities.

Another challenge is the lack of physical activity caused by inactive lifestyles, increased screen time, and limited access to safe recreational spaces. In many countries, health education programs are also insufficient, preventing people from making informed decisions about nutrition and exercise.

In addition, economic inequalities continue to affect obesity rates. Many individuals face difficulties accessing affordable healthy foods and healthcare

services. Furthermore, while governments and international organizations have introduced various initiatives, differences in national policies and limited funding often reduce their effectiveness. Addressing these gaps will require stronger international cooperation, public awareness efforts, and long-term policy commitments.

8. Critical Countries

a. United States

The United States is one of the countries most affected by obesity and is often at the center of global discussions on public health. High consumption of processed foods, large portion sizes, sedentary lifestyles, and widespread fast-food culture have contributed to increasing obesity rates among both adults and children. Obesity is associated with significant healthcare costs and a higher prevalence of diseases such as diabetes and cardiovascular conditions.

At the same time, the United States has implemented several initiatives to address the issue. Programs such as the *Let's Move!* campaign and the *Healthy, Hunger-Free Kids Act* aimed to improve nutrition, encourage physical activity, and reduce childhood obesity. Due to its influence on global food markets, public health policies, and nutrition research, the United States plays a key role in international efforts to combat obesity.

b. Mexico

Mexico has one of the highest obesity rates in the world and faces serious health challenges related to obesity, including diabetes and heart disease. In response, the government introduced a tax on sugar-sweetened beverages in 2014 to reduce consumption and encourage healthier choices. Mexico is often cited as an important example of how economic policies can be used to address obesity.

c. Chile

Chile is recognized for its innovative policies aimed at improving public health. The country introduced strict food-labeling regulations and restrictions on the marketing of unhealthy foods to children. These measures have helped raise awareness about nutrition and have become a model for other countries seeking to reduce obesity rates.

d. China

China has experienced a rapid increase in obesity rates due to economic growth, changing diets, and reduced physical activity. Increased consumption of processed foods and urban lifestyles have contributed to this trend. As one of the world's most populous countries, China's approach to obesity prevention has significant implications for global public health.

e. India

India faces a unique challenge known as the "double burden of malnutrition," where undernutrition and obesity exist at the same time. Rapid urban development, lifestyle changes, and increased consumption of unhealthy foods have led to rising obesity rates, particularly in urban areas. As a result, India is an important country in discussions on nutrition, public health, and obesity prevention.

9. Questions a Resolution Should Address

1. How can governments encourage healthier eating habits among their populations?
2. What measures can be taken to increase physical activity among children, adolescents, and adults?
3. How can countries improve access to affordable and nutritious food, especially in low-income communities?
4. What role should schools play in promoting healthy lifestyles and preventing childhood obesity?
5. How can governments regulate the marketing and advertising of unhealthy food products, particularly those targeted at children?
6. Should taxes on sugar-sweetened beverages be implemented to reduce obesity rates, and how effective are such measures?
7. How can public awareness and health education campaigns help prevent obesity and promote healthier lifestyles?
8. What strategies can be adopted to address the socioeconomic factors contributing to obesity?
9. How can WHO and other international organizations support member states in combating the global obesity epidemic?
10. What long-term policies can be implemented to ensure sustainable obesity prevention and improved public health outcomes?
